Reflection Questions for Students

Which features are the most important in classifying Iris species?

The petal length and width are the most important for telling Iris flowers apart the sepal length and width are less important

Why do you think petal size is more useful than sepal size?

The petal size is very different between the three iris and the sepal size look more alike so its harder to use that is why the petal size gives a clearer signal to the model

How would the model perform if we only used sepal features?

The model will still work but not accurate the accuracy drops because the versicolor
